Green Hydrogen truck means Zero CO2 emissions for INEOS Inovyn PVC deliveries between Tavaux and Dijon

- INEOS Inovyn is to become the first company in Europe to use a hydrogen truck for PVC transportation. The new truck was presented at this year's INOVYN Awards ceremony on 20 October.
- Deliveries with the new truck will begin at the end of Q1 2023, from INEOS Inovyn's PVC production plant in Tavaux to Benvic's plant in Dijon.
- It is expected that 60 tonnes of CO₂ emissions will be saved each year thanks to this initiative.
- Similar projects are already foreseen in the Netherlands and Belgium.

60 tonnes of CO₂ will be saved every year when INEOS Inovyn brings its new Hydrogen truck into service to deliver PVC from its production plant in Tavaux to Benvic's PVC compound plant in Dijon. From April 2023, this carbon dioxide emissions from the deliveries will be reduced to zero.
