TENAX maximizes the potential of carbon fiber.

Products
TENAX

— Chopped Fiber

Chopped fiber is carbon fiber with high strength and elastic modulus that is bundled using an optimal sizing agent, and chopped into designated lengths suitable to each application. Used mainly as a reinforcing material in thermoplastics, it is widely used in the IT industry, since it can give plastic conductivity.

We provide products suitable for any specific resin, application or process by sizing treatment to improve the reinforcing effect and workability.
